

# Release Note Outlook-Connector

version 2.1.3  
(previous version 2.1.2)

---

## 1. Extensions

- All windows (forms) were centered.
- coTask is minimized at start and is displayed as symbol in the system tray.
- After every synchronisation the client informations to the synchronisation stand remain.
- The application can only be started one time.
- In Log is saved, when and with which device has been synchronized. This information can be shown in logwindow.

## 2. Bugfixes

- Occasional the icon in the system tray fade out, although the application runs. By clicking the icon in the system tray, the application will be minimized or displayed.
- The connection problems to „Bonjour“ were repaired; the service „Bonjour“ has to be installed before the using of coTask (version (2.0.4.0.) or up).
- When the application is started for the first time, the programm recognises this and goes through the right steps now to conclude the configuration.
- In the configuration only the „tasks“ of one outlook-account can be selected, which can be synchronized; it cannot be selected everything any more (for example. „input“), what led under circumstances to the fall of the application.
